Edwin

For Lab 07 I set up the lab notebook in Google Colab and worked through all four parts of the model evaluation exercise. When the notebook failed to run on the first attempt, I diagnosed the problem and confirmed it was a formatting issue in the notebook file itself rather than an error in the lab code, then corrected the file so the cells would execute properly. I also updated the deprecated pandas fillna call in the setup cell so the data preparation step would run without errors on the current library version. I completed all three required code tasks, generating the confusion matrix and heatmap, the classification report, and the five fold cross validation results. I wrote the answers to all three Knowledge Check questions, using the model output from our own run to support each response. I created the Lab07 folder in our shared Drive, organized the notebook file inside it, and coordinated with the team on submission requirements and file naming.

Kala Hayes

For Lab 07, I created the Lab07 folder in our GitHub repository and uploaded the required documents. I verified that all the cells ran successfully on my machine, reviewed the outputs, and confirmed that all documents met the assignment requirements. I submitted the repository link to Canvas on 7/22/26 once confirmed with the team if any other additional information was needed.

Anashrah Adil

For Lab 07, I contributed by running the notebook independently to verify our results, reviewing Knowledge Check answers for accuracy, researching precision-recall trade-offs with concrete examples for the team, and collaborating on the reflective journal. My analysis of the confusion matrix highlighted how raw accuracy can hide critical misclassifications such as false negatives in stroke prediction and I helped demonstrate why reporting 5-fold cross-validation results provides a far more reliable measure of model performance than a single train-test split.

Zain Ahmed:

For Lab 07 I ran the notebook independently on my own machine to verify that my results matched the rest of the team's output. I confirmed the confusion matrix, classification report, and cross-validation scores were consistent before we submitted.
