

Contribution Journal

Group Members Names:

Edwin Alvarado, Kala Hayes, Anashrah Adil, Zain Ahmed

Class: 6263-ITAI-1371 Intro to Machine Learning-S10-12321

Edwin Alvarado:

For the Module 3 lab on the machine learning workflow and types of learning, I worked through the notebook in Google Colab, running all 25 cells and confirming that each output displayed correctly, including the EDA plots, the model comparison, and the confusion matrix. I completed the final reflection cell, explaining the differences between supervised, unsupervised, and reinforcement learning in my own words, and analyzing the wine classification results, where logistic regression was the stronger model at 88.9 percent accuracy compared to the decision tree at 83.3 percent. I coordinated with teammates through our group chat to track which parts each member had completed, specifically following up on parts 9 and 10 to confirm they had been run.

Kala Hayes:

For Module 3, I ran the codes for Parts 2-8 of the lab and verified that they executed correctly. I also coordinated with my teammates by informing them of the sections I had completed and identifying the remaining tasks that still need to be finished. Additionally, I completed the "Now Your Turn" subsection in Part 9, which involved determining the most appropriate type of machine learning to apply to each given scenario. As well, wrote the reflective journal on behalf of our team analysis I was also responsible for uploading the complete lab, contribution list, and reflective journal to both Canvas and GitHub

Anashrah Adil:

I ran and understood all the cells and Machine Learning Workflow. Explored Machine Learning Types in depth and answered the four Reflection Questions related to challenges and most interesting part of machine learning workflow at the end of file. I also explored the difference in accuracy of the model by performing a Personal Experiment and changing the features using 'alcohol', 'flavanoids', 'od280/od315_of_diluted_wines' and getting a higher accuracy rate in contrast to other features.

Zain Ahmed:

For Module 3, I ran through the Colab notebook cell by cell and made sure everything was outputting correctly, including the plots, model results, and accuracy scores. I wasn't just clicking run though, I was actually trying to follow along and understand what each part was doing, like why the data gets split the way it does and what the numbers at the end actually mean. I went through the code in my sections and my teammates sections to catch anything that wasn't running right, and before we finalized everything, I read over the reflective journal to clean up any grammar issues and make sure it all made sense together.
