Class: 6263-ITAI-1371 Intro to Machine Learning-S10-12321

Edwin: For this lab, I handled the classification pipeline and the team coordination. For Task 2, I built the LogisticRegression model to predict passenger survival, trained it on the training set, generated predictions on the test set, and evaluated it using `accuracy_score`. I learned why `accuracy_score` fits a classification task with discrete labels, which is different from the `mean_squared_error` we used on the regression model. I also organized the shared Drive folder, kept the group chat updated on who was doing what, and made sure every deliverable was finished and submitted on time. I answered the knowledge questions and collaborated with the team throughout.

Kala Hayes:

For the lab, I reviewed the completed Colab notebook to verify that all of the code, imports, variable names, and outputs were correct before submission. I organized the project files, uploaded the final notebook to GitHub, and submitted the completed assignment for the team. I learned how missing data (NaN values) can cause machine learning models to fail and why data cleaning is important before training. I also learned how categorical features, such as Sex, must be converted to numerical values, how `mean_squared_error` is used to evaluate linear regression models, and how `accuracy_score` is used to evaluate logistic regression models.

Anashrah Adil:

For this lab, I went through the entire colab file and fixed all the codes. I did all the required tasks to complete the lab. For Task 1, I created the model instance of LinearRegression model named lr_model. Trained the model, made predictions, and evaluated using mean_squared_error. I learned why we used mean_squared_error to evaluate the regression model instead of accuracy_score. I answered the knowledge questions as well and collaborated with the team.

Zain Ahmed:

For this lab I worked on the data preparation steps that both models needed. Before Task 1, I dropped the rows with missing Age values and defined the features and target for the regression part, then split data into training and test sets. I also went through the notebook to test that the cells ran in order without errors. I collaborated with the team throughout the lab.
