Edwin:

For this lab I focused on reviewing and quality checking the team's work. After Kala uploaded the notebook and got the cells running, I went through each part to make sure the code executed correctly and the outputs matched what the instructions were asking for. My main focus was helping Kala on Part 4, the student experimentation section I worked with her on the Embarkation and Fare vs. Survival plots, helped test the code, and checked that the charts displayed properly and the insights made sense. In addition, completed the knowledge check session. Before submission, I did a final review of the whole notebook to confirm everything was complete and consistent.

Kala Hayes:

I uploaded module 5 to Google Colab so the entire team could access the module. I also corrected the formatting issues in the code cells from Parts 1-3, as the initial uploads caused syntax errors due to incorrect spacing and indentation, which prevented some cells from running properly. After fixing these issues, I executed each cell to ensure the code ran successfully and produced expected visualizations. In part 4, I developed my own code based on the previous examples and adjusted the variables as specified in the instructions. Then troubleshooted the code until they showcased visuals. I also uploaded the necessary documents for this lab to both GitHub and Canvas.

Anashrah Adil:

I executed each cell to understand the concept of EDA and how graphs help us visualize the data. After running all cells and getting the concepts of this lab, I added two personal experiments to increase my knowledge areas and see how I can implement what I learned. Experiment one demonstrates how to visualize missing data values using Seaborn's heatmap

and creating a visual map of where our null data values lie in our dataset. Second experiment is to create a visualization using correlation matrix and get a gist of how all the numerical values relate to each other. This was my contribution to Lab04.

Zain Ahmed:

For this lab I ran all the cells from top to bottom and read through the explanations to understand what each visualization was showing. I looked at the plots for survival by class, gender, and age and used what I found to answer the three knowledge check questions. I also added my own experiment at the end where I made a chart showing how survival changed based on how many siblings or spouses a passenger had onboard.
