

# Contribution Journal

Group Members Names:

Edwin Alvarado, Kala Hayes, Anashrah Adil, Zain Ahmed

Class: 6263-ITAI-1371 Intro to Machine Learning-S10-12321

## Edwin:

I was responsible for writing the reflective journal for the Module 2 lab, analyzing the learning experience gained from working with Python libraries such as pandas, NumPy, and matplotlib. I also expanded the scatter plot analysis to highlight that setosa has the largest average sepal width while versicolor and virginica overlap more closely, and I wrote the reflection answer in the final cell of the lab notebook describing what the team learned about using these tools together. I coordinated with team members regarding submission requirements, confirming the correct file naming conventions, the number of files needed, and the deadline for Canvas submission. I also ensured the team understood that the contribution journal needed to be submitted as a separate document alongside the lab notebook and reflective journal. Additionally I communicated with teammates through our group chat to keep everyone informed and on track before the due date.

## Kala Hayes:

For Module 2, I was responsible for uploading the assignment into Google Colab and verifying that it functioned correctly. I executed each code cell individually to troubleshoot any issues and confirm that the code ran as expected. After reviewing the data visualization outputs, I completed the analysis under the “Key Findings from the Visualization” and the “Questions for Further Investigation” sections associated with the lab. Once the module was completed, I informed my team through WhatsApp and shared the Google Colab link for review. I also transferred the Module 2 shared document to the team folder that Anasha created to ensure all project materials were organized and accessible to team members.

## Anashrah Adil:

I navigated and went through the entire Colab notebook, ran all the cells individually to gain understanding of the dataset, how to perform operations and visualize data. At the end of the notebook I also performed a personal experiment by visualizing data using Petal features and observed that its accuracy is much higher than the Sepal features. Throughout the assignment I collaborated with my group members and helped them with the compilation.

## Zain Ahmed:

In Module 2, I executed each cell and worked through the entire Colab notebook, developing a step-by-step understanding of the data, what was being done with it, and how the visualizations were being created. This helped me to have a better understanding of the interaction between each part of the notebook than just viewing the finished products. One of the more valuable things I learned was how the various features would impact the model. At the end of the notebook I did an experiment to see if there were any difference in the classification accuracy of the visualizations between the Sepal features and Petal features, and found that the Petal features produced significantly better classification accuracy. For group work, I collaborated with teammates and helped with any compilation problems. I checked the code in both my and their work to make sure the cells run correctly and the output is as expected. I went back through the reflective journal before finalising it, to check for grammatical errors and ensure that the writing flows well and makes sense in the context.
